Grados de libertad

$n - 1$

para intervalos de confianza o pruebas de hipótesis con desviación estándar o varianza

$k - 1$

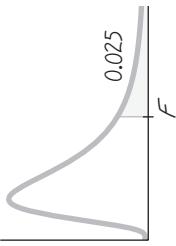

para experimentos multinomiales o bondad de ajuste con k categorías

$(r - 1)(c - 1)$

para tablas de contingencia con r renglones y c columnas

$k - 1$

para la prueba de Kruskal-Wallis con k muestras

NOTAS:

1. * indica que no es posible obtener un valor en la región crítica.
2. Rechace la hipótesis nula si el número del signo menos frecuente (x) es menor que o igual al valor en la tabla.
3. Para valores de n mayores que 25, se utiliza una aproximación normal con

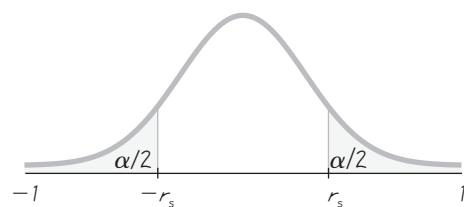

$$z = \frac{(x + 0.5) - \left(\frac{n}{2}\right)}{\frac{\sqrt{n}}{2}}$$

NOTAS:

1. Para $n > 30$, utilice $r_s = \pm z/\sqrt{n-1}$ donde z corresponde al nivel de significancia. Por ejemplo, si $\alpha = 0.05$, then $z = 1.96$.
2. Si el valor absoluto del estadístico de prueba r_s excede al valor crítico positivo, entonces rechace $H_0: \rho_s = 0$ y concluya que existe una correlación.

NOTAS:

- Los valores en esta tabla son los valores críticos G , suponiendo una prueba de dos colas con un nivel de significancia de $\alpha = 0.05$.
- La hipótesis nula de aleatoriedad se rechaza si el número total de rachas G es menor que o igual al valor más bajo, o si es mayor que o igual al valor más alto.
